allows developers to test SharePoint web services via localhost in the absence of the actual SharePoint farm environment. The key macro collects the results of the tests, with each test executed a separate sub routine. Once all of the

tests are complete, the results are written to a file and the file can be used as a tool for testing if the development and design implementations are done properly. With a few shortcuts, the developer can run the key macro for a web application to see if

the application can be deployed to SharePoint. The key macro can be run directly from the browser or you can use the WebServices Client Object Model (WSCOM) to call the key macro.
